

**Table 2: Comparison of the experimental cytosolic sample with the complete predicted *E. coli* proteome with respect to the number of predicted transmembrane segments (TMS), cellular localization from the PSORT-database and experimental localization data (EXP). Shown is the amount of unique proteins and the relation to the measured number of molecules in the cell.**

Attribute <sup>a</sup>	<i>E. coli</i> complete		Experimental cytosolic dataset

<sup>a</sup> Annotated attributes of the proteins depicted as logical statements. An ampersand (&) indicates that both conditions must be fulfilled ('and'), a vertical line (|) indicates 'or'. The following abbreviations are used:

TMS – number of predicted transmembrane segments

PSORT – localization annotation from the PSORT database (C Cytoplasmic, CM Cytoplasmic Membrane, E Extracellular, OM Outer Membrane, P Periplasmic, U Unknown, UM Unknown – this protein may have multiple localization sites)

EXP – experimental localization data from [71] (C Cytoplasmic, IM Inner membrane, OM Outer Membrane, P Periplasmic)

<sup>b</sup> Number of unique proteins with the given attributes annotated

<sup>c</sup> Percentage of the unique proteins relative to the sum of unique proteins in the predicted *E. coli* proteome or in the experimental cytosolic sample, respectively

<sup>d</sup> Percentage of the actual number of protein copies found in the experimental sample, i.e. fraction of the total protein copy number sum.
