Results from this work in DPhPC/n-decane and DphPC/n-decane bilayers at 298 K have relative uncertainties of ~50%. Apparent free energies of transfer, $\Delta G_{\text{trans}}^{\text{app}}$, and estimated peak energy barriers, W_{peak} , for GuanH⁺, K⁺ and Cl⁻ from this study in DPhPC/n-decane and DphPC/n-decane bilayers have uncertainties of ~1 kcal/mol.

^aExperimental results from Papahadjopoulos et al. (13), for bovine brain PS bilayers at 309 K, with peak values estimated at 300 K.

^bExperimental results from Paula and co-workers (2,3) for DOPC at 303K.

^cExperimental results from Hauser et al. (11) at 277 K and pH 5.5 for Cl⁻.
