

**Table 1. Intracellular Regulation of IDPs and Ordered Proteins<sup>a</sup>**

| cellular quantity/regulation mechanism            | ordered proteins | disordered proteins |
|---|------------------|---------------------|
| mRNA level  |                  |                     |
| transcription factors/gene                        | 2.0              | 2.0                 |
| transcriptional rate (mRNAs/hour)                 | 2.2              | 1.8                 |
| transcript abundance (copies per cell)            | 0.9              | 0.8                 |
| transcript half-life (min.)                       | 23.0             | 19.0                |
| transcript degradation (% with short polyA tails) | 28               | 56                  |
| miRNA targeting (% sequences) <sup>b</sup>        | 15               | 30                  |
| protein level                                     |                  |                     |
| translational rate (ribosomes/ORF)                | 0.5              | 0.37                |
| protein abundance (proteins/cell)                 | 2900             | 1860                |
| protein half-life (min.)                          | 45               | 37                  |
| % PEST sequences                                  | 19               | 42                  |
| ubiquitination sites <sup>b,c</sup>               | 50               | 70                  |

<sup>a</sup>Data from *S. cerevisiae*, adapted from ref 252, except, <sup>b</sup>entries obtained from human tissues and cell lines, adapted from ref 253. <sup>c</sup>Percentage of proteins with one or more predicted ubiquitination sites.
