

Table 1. *In vitro* comparison of λ P_R and x3

	P _R	x3
k_{on}	$6.7 \times 10^6 \text{ M}^{-1} \text{ sec}^{-1}$	$6.2 \times 10^4 \text{ M}^{-1} \text{ sec}^{-1}$
k_2	$1 \times 10^{-2} \text{ sec}^{-1}$	$2 \times 10^{-3} \text{ sec}^{-1}$
$k_{\text{off}} (k_{-2})$	$3.7 \times 10^{-5} \text{ sec}^{-1}$	$4.0 \times 10^{-5} \text{ sec}^{-1}$
K_{I}	$6.7 \times 10^8 \text{ M}^{-1}$	$3.1 \times 10^7 \text{ M}^{-1}$
K_{II}	270	50
K_{O}	$1.8 \times 10^{11} \text{ M}^{-1}$	$1.6 \times 10^9 \text{ M}^{-1}$

Values for the kinetic constants k_2 and k_{on} were obtained from the intercepts (intercept = $1/k_2$) and the slopes ($1/S = k_1 k_2 / k_{-1} = k_{\text{on}}$) of Fig. 2. k_{off} was determined by the poly[d(A-T)] challenge techniques described in *Materials and Methods* and in Fig. 3. Values for k_{off} determined by heparin challenge (50 $\mu\text{g/ml}$) are $4.3 \times 10^{-5} \text{ sec}^{-1}$ for P_R and $3.9 \times 10^{-5} \text{ sec}^{-1}$ for x3. The equilibrium constants were calculated from the ratios $K_{\text{I}} = k_{\text{on}}/k_2$, $K_{\text{II}} = k_2/k_{\text{off}}$, $K_{\text{O}} = k_{\text{on}}/k_{\text{off}}$.
